SIEffect.py	43
-----------------------------	-------	----

Chapter 5

Namespace Documentation

5.1 SIEffect Namespace Reference

Documentation for this module / class.

Classes

- class [SIEffect](#)
Super Class from which all subsequent plugins are derived.

5.1.1 Detailed Description

Documentation for this module / class.

Used as central entry point for all SIGRun plugins

Chapter 6

Class Documentation

6.1 SIEffect.SIEffect Class Reference

Super Class from which all subsequent plugins are derived.

Inheritance diagram for SIEffect.SIEffect:

Collaboration diagram for SIEffect.SIEffect:

Public Member Functions

- None `__init__` (self, PySI.PointVector `shape`, str `uuid`, str `texture_path`, int `regiontype`, str `regionname`, dict `kwargs`, `__source__`="custom")
constructor
- int `get_region_width` (self)
member function for retrieving the maximum width of a region
- int `get_region_height` (self)
member function for retrieving the maximum height of a region
- int `relative_x_pos` (self)
member function for getting the relative x coordinate of the parent region's top left corner
- int `relative_y_pos` (self)
member function for getting the relative y coordinate of the parent region's top left corner
- int `absolute_x_pos` (self)
member function for getting the absolute x coordinate of the parent region's top left corner
- int `absolute_y_pos` (self)
member function for getting the absolute y coordinate of the parent region's top left corner
- None `enable_effect` (self, str `capability`, bool `is_emit`, object `on_enter`, object `on_continuous`, object `on_leave`)
member function for enabling the emission or reception of an effect
- bool `is_effect_enabled` (self, str `capability`, bool `is_emit`)
member function for determining whether a collision event exists
- None `override_effect` (self, str `capability`, bool `is_emit`, object `on_enter`, object `on_continuous`, object `on_leave`)
member function for overriding the emission or reception of an effect
- None `disable_effect` (self, str `capability`, bool `is_emit`)
member function for disabling the emission or reception of an effect
- None `enable_link_emission` (self, str `emission_capability`, object `emission_function`)
member function for enabling the emission of data in the context of a link event
- None `enable_link_reception` (self, str `emission_capability`, str `reception_capability`, object `reception_function`)
member function for enabling the emission of data in the context of a link event
- None `disable_link_emission` (self, str `emission_capability`)
member function for disabling the emission of data in the context of a link event
- None `disable_link_reception` (self, str `emission_capability`, `reception_capability`="")
member function for disabling the reception of data in the context of a link event
- None `create_link` (self, str `sender_uuid`, str `sender_attribute`, str `receiver_uuid`, str `receiver_attribute`)
member function for establishing a specified link between two regions according to given attributes
- None `remove_link` (self, str `sender_uuid`, str `sender_attribute`, str `receiver_uuid`, str `receiver_attribute`)
member function for removing a specified link between two regions according to given attributes
- None `emit_linking_action` (self, object `sender`, str `capability`, tuple `args`)
member function for emitting a linking action
- None `set_QML_data` (self, str `key`, object `value`, int `datatype`, `data_kwargs`={})
member function for setting data in the associated qml file of a region effect
- object `get_QML_data` (self, str `key`, int `datatype`)
member function for getting data set from an associated qml file of a region effect
- str `set_QML_path` (self, str `filename`)
member function for setting the path to an plugin's associated qml file
- None `add_point_to_region_drawing` (self, float `x`, float `y`, str `cursor_id`)
member function for adding a point to a region drawing based on a cursor id.
- None `register_region_from_drawing` (self, str `cursor_id`)
member function for registering a region drawing according to a cursor id
- None `start_standard_application` (self, str `file_uuid`, str `file_path`)

- member function for starting the standard application of a file given its uuid as a region and its path in the filesystem*
- None [close_standard_application](#) (self, str file_uuid)
 - member function for closing the standard application of a file given its uuid as a region and its path in the filesystem*
- None [display_folder_contents_page](#) (self, int page, str source_uuid, with_buttons=True)
 - member function for displaying the contents of a folder in the filesystem as pages of other filesystem entries*
- None [delete](#) (self)
 - member function for deleting a region*
- None [create_region_via_name](#) (self, PySI.PointVector [shape](#), str effect_name, as_selector=False, kwargs={})
 - member function for creating a new region*
- None [create_region_via_id](#) (self, PySI.PointVector [shape](#), str effect_type, kwargs={})
 - member function for creating a new region*
- list [available_plugins](#) (self)
 - member function for retrieving the plugins which are available for sketching as a dict of names.*
- None [snap_to_mouse](#) (self)
 - member function for snapping a region's center to the mouse cursor*
- tuple [context_dimensions](#) (self)
 - member function for retrieving the dimensions of the active SI-Context (width in px, and height in px)*
- None [assign_effect](#) (self, str effect_name_to_assign, str effect_display_name, dict kwargs)
 - member function for assigning a new effect to a region if the region is a cursor, the effect that cursor can draw is changed instead!*
- None [move](#) (self, x, y)
 - member function for moving the effect's associated region to the point (x, y)*
- None [__handle_exception__](#) (self, Exception ex, str file)
 - member function for generally handling exceptions which may occur in constructors of plugins*

Static Public Member Functions

- def [on_enter](#) (capability, transmission_type)
 - Decorator for registering on_enter collision events.*
- def [on_continuous](#) (capability, transmission_type)
 - Decorator for registering on_continuous collision events.*
- def [on_leave](#) (capability, transmission_type)
 - Decorator for registering on_leave collision events.*
- def [on_link](#) (transmission_type, emission_capability, reception_capability=None)
 - Decorator for registering linking actions.*

Public Attributes

- [with_border](#)
 - member attribute variable serving as a rendering hint for showing a regions border*
- [shape](#)
 - member attribute variable containing the shape (contour) of a drawn region as a PySI.PointVector*
- [width](#)
 - member attribute variable containing the axis-aligned bounding-box (aabb) of a drawn region as a PySI.PointVector*
- [height](#)
 - member variable containing the maximum height of the region*
- [name](#)
 - member attribute variable containing the name of a drawn region as a str*
- [region_type](#)

- member attribute variable containing the type of effect of a drawn region as a `PySI.EffectType`*
- [source](#)
 - member attribute variable containing the source of effect of a drawn region as a `str`*
- [qml_path](#)
 - member attribute variable containing the path to a QML file for styling of a drawn region as a `str`*
- [delta_x](#)
 - member attribute variable containing the last relative movement of the region according to the x axis as a `float`*
- [delta_y](#)
 - member attribute variable containing the last relative movement of the region according to the y axis as a `float`*
- [last_x](#)
 - member attribute variable containing the last absolute x coordinate as a `float`*
- [last_y](#)
 - member attribute variable containing the last absolute y coordinate as a `float`*
- [color](#)
 - member attribute variable containing the fill color of a region in RGBA as a `PySI.Color`*
- [is_under_user_control](#)
 - member attribute variable which is true when an user directly controls the region (e.g.*
- [texture_path](#)
 - member attribute variable storing the path to the image file used as texture for a region*
- [texture_width](#)
 - member attribute variable storing the width of a texture of a region drawing as a `float`*
- [texture_height](#)
 - member attribute variable storing the height of a texture of a region drawing as a `float`*
- [cap_emit](#)
 - member attribute variable storing keys to functions which are called when collision events occur for emitting data to receiving regions*
- [cap_rcv](#)
 - member attribute variable storing keys to functions which are called when collision events occur for receiving data from emitting regions*
- [cap_link_emit](#)
 - member attribute variable storing keys to functions which are called when linking events occur for emitting data to receiving regions*
- [cap_link_rcv](#)
 - member attribute variable storing keys to functions which are called when linking events occur for emitting data to receiving regions*
- [mouse_x](#)
 - member attribute variable storing the x position of the mouse cursor*
- [mouse_y](#)
 - member attribute variable storing the y position of the mouse cursor*
- [x](#)
- [y](#)

Static Public Attributes

- bool [EMISSION](#) = True
 - member constant to mark an effect or link emittable*
- bool [RECEPTION](#) = False
 - static member attribute to mark an effect or link receivable*
- string [TEXTURE_PATH_NONE](#) = ""
 - static member attribute to signal that it's associated effect does not display an icon (texture) when drawn as a region*
- bool [RESAMPLING](#) = True
 - static member attribute to notify SIGRun to resample a region's shape when changed from PySI*
- bool [NO_RESAMPLING](#) = False
 - static member attribute to notify SIGRun to not resample a region's shape when changed from PySI Use with caution! May lead to unexpected / barely debuggable behaviour!*

6.1.1 Detailed Description

Super Class from which all subsequent plugins are derived.

This Class itself is derived from PySI written in C++ which is documented separately within SIGRun

Definition at line 15 of file SIEffect.py.

6.1.2 Constructor & Destructor Documentation

6.1.2.1 __init__()

```
None SIEffect.SIEffect.__init__ (
    self,
    PySI.PointVector shape,
    str uuid,
    str texture_path,
    int regiontype,
    str regionname,
    dict kwargs,
    __source__ = "custom" )
```

constructor

Constructs a new [SIEffect](#) object based on the given arguments.

Parameters

<i>self</i>	the object pointer
<i>shape</i>	the contour of the drawn region (PySI.PointVector)
<i>aabb</i>	the axis-aligned bounding-box of the drawn region (PySI.PointVector)
<i>uuid</i>	the universally unique identifier of the drawn region (str)
<i>texture_path</i>	the path to an image intended to be used as an icon for the drawn region (str)
<i>kwargs</i>	keyworded arguments which may necessary for more specific implementations of region effects (dict)
<i>source</i>	the source of the plugin e.g. standard environment library (str)

Returns

None

Definition at line 133 of file SIEffect.py.

6.1.3 Member Function Documentation

6.1.3.1 `__handle_exception__()`

```
None SIEffect.SIEffect.__handle_exception__ (
    self,
    Exception ex,
    str file )
```

member function for generally handling exceptions which may occur in constructors of plugins

Author

Robert Fent (as part of his Bachelor's Thesis)

Parameters

<i>ex</i>	the thrown exception as an Exception object
<i>file</i>	the absolute path to the plugin file in which the exception occurred

Returns

None

Definition at line 682 of file SIEffect.py.

6.1.3.2 `absolute_x_pos()`

```
int SIEffect.SIEffect.absolute_x_pos (
    self )
```

member function for getting the absolute x coordinate of the parent region's top left corner

Parameters

<i>self</i>	the object pointer
-------------	--------------------

Returns

the absolute x coordinate of the associated region's top left corner

Definition at line 327 of file SIEffect.py.

6.1.3.3 `absolute_y_pos()`

```
int SIEffect.SIEffect.absolute_y_pos (
    self )
```

member function for getting the absolute y coordinate of the parent region's top left corner

Parameters

<i>self</i>	the object pointer
-------------	--------------------

Returns

the absolute y coordinate of the associated region's top left corner

Definition at line 335 of file SIEffect.py.

6.1.3.4 add_point_to_region_drawing()

```
None SIEffect.SIEffect.add_point_to_region_drawing (
    self,
    float x,
    float y,
    str cursor_id )
```

member function for adding a point to a region drawing based on a cursor id.

Parameters

<i>self</i>	the object pointer
<i>x</i>	the x coordinate of the cursor (float)
<i>y</i>	the y coordinate of the cursor (float)
<i>cursor_id</i>	the id of cursor currently drawing (str)

This function is specific to effects of PySI.EffectType.SI_CANVAS. Therefore, this function does nothing when called with other effect types.

Returns

None

Definition at line 549 of file SIEffect.py.

6.1.3.5 assign_effect()

```
None SIEffect.SIEffect.assign_effect (
    self,
    str effect_name_to_assign,
    str effect_display_name,
    dict kwargs )
```

member function for assigning a new effect to a region if the region is a cursor, the effect that cursor can draw is changed instead!

Parameters

<i>self</i>	the object pointer
<i>effect_name_to_assign</i>	the name of the effect which is intended to be written to a region
<i>effect_display_name</i>	the name of the effect which is intended to be visible to a user
<i>kwargs</i>	key-worded arguments containing specifics of certain regions

Returns

None

Definition at line 662 of file SIEffect.py.

6.1.3.6 available_plugins()

```
list SIEffect.SIEffect.available_plugins (
    self )
```

member function for retrieving the plugins which are available for sketching as a dict of names.

This dict of names uses region_name attributes as keys and region_display_name attributes as values

Parameters

<i>self</i>	the object pointer
-------------	--------------------

Returns

a list containing all names of available plugins as str values

Definition at line 633 of file SIEffect.py.

6.1.3.7 close_standard_application()

```
None SIEffect.SIEffect.close_standard_application (
    self,
    str file_uuid )
```

member function for closing the standard application of a file given its uuid as a region and its path in the filesystem

Parameters

<i>self</i>	the object pointer
<i>file_uuid</i>	the uuid of the region associated to a file icon representing a file of the filesystem (str)

Returns

None

Definition at line 585 of file SIEffect.py.

6.1.3.8 context_dimensions()

```
tuple SIEffect.SIEffect.context_dimensions (
    self )
```

member function for retrieving the dimensions of the active SI-Context (width in px, and height in px)

Parameters

<i>self</i>	the object pointer
-------------	--------------------

Returns

the dimensions of the active SI context as a tuple

Definition at line 650 of file SIEffect.py.

6.1.3.9 create_link()

```
None SIEffect.SIEffect.create_link (
    self,
    str sender_uuid,
    str sender_attribute,
    str receiver_uuid,
    str receiver_attribute )
```

member function for establishing a specified link between two regions according to given attributes

Parameters

<i>self</i>	the object pointer
<i>sender_uuid</i>	the uuid of the emitting region (str)
<i>sender_attribute</i>	the attribute to be linked by the emitting region (str)
<i>receiver_uuid</i>	the uuid of the receiving region (str)
<i>receiver_attribute</i>	the attribute to be linked by the receiving region (str)

Returns

None

Definition at line 478 of file SIEffect.py.

6.1.3.10 create_region_via_id()

```
None SIEffect.SIEffect.create_region_via_id (
    self,
    PySI.PointVector shape,
    str effect_type,
    kwargs = {} )
```

member function for creating a new region

Parameters

<i>self</i>	the object pointer
<i>shape</i>	the shape / contour of the region as a PySI.PointVector or list [[x1, x1], [x2, y2], ... [xn, yn]]
<i>effect_name</i>	the name (region_name) of the effect which shall be assigned to the region (region_display_name does not work)

Returns

None

Definition at line 624 of file SIEffect.py.

6.1.3.11 create_region_via_name()

```
None SIEffect.SIEffect.create_region_via_name (
    self,
    PySI.PointVector shape,
    str effect_name,
    as_selector = False,
    kwargs = {} )
```

member function for creating a new region

Parameters

<i>self</i>	the object pointer
<i>shape</i>	the shape / contour of the region as a PySI.PointVector or list [[x1, x1], [x2, y2], ... [xn, yn]]
<i>effect_name</i>	the name (region_name) of the effect which shall be assigned to the region (region_display_name does not work)

Returns

None

Definition at line 614 of file SIEffect.py.

6.1.3.12 delete()

```
None SIEffect.SIEffect.delete (
    self )
```

member function for deleting a region

Parameters

<i>self</i>	the object pointer
-------------	--------------------

Returns

None

Definition at line 604 of file SIEffect.py.

6.1.3.13 disable_effect()

```
None SIEffect.SIEffect.disable_effect (
    self,
    str capability,
    bool is_emit )
```

member function for disabling the emission or reception of an effect

Parameters

<i>self</i>	the object pointer
<i>capability</i>	the capability of the collision event (str)
<i>is_emit</i>	the variable depicting if a region emits (True) or receives (False) an effect (bool)

Returns

None

Definition at line 397 of file SIEffect.py.

6.1.3.14 `disable_link_emission()`

```
None SIEffect.SIEffect.disable_link_emission (
    self,
    str emission_capability )
```

member function for disabling the emission of data in the context of a link event

Parameters

<i>self</i>	the object pointer
<i>emission_capability</i>	the capability of the linking event used by the emitting region (str)

Returns

None

Definition at line 445 of file SIEffect.py.

6.1.3.15 `disable_link_reception()`

```
None SIEffect.SIEffect.disable_link_reception (
    self,
    str emission_capability,
    reception_capability = "" )
```

member function for disabling the reception of data in the context of a link event

Parameters

<i>self</i>	the object pointer
<i>emission_capability</i>	the capability of the linking event used by the emitting region (str)
<i>reception_capability</i>	the capability of the linking event of a receiving region with default value "" (str)

If no `reception_capability` is specified, the `emission_capability` is deleted from `self.cap_link_rcv`. If `reception_capability` is specified and present in `self.cap_link_rcv`, the specified relation is deleted from `emission_capability`.

See also

`self.cap_link_rcv`

Returns

None

Definition at line 460 of file SIEffect.py.

6.1.3.16 display_folder_contents_page()

```
None SIEffect.SIEffect.display_folder_contents_page (
    self,
    int page,
    str source_uuid,
    with_buttons = True )
```

member function for displaying the contents of a folder in the filesystem as pages of other filesystem entries

Parameters

<i>self</i>	the object pointer
<i>page</i>	the number of the current page which browsed in a folder region
<i>source_uuid</i>	the uuid of the region associated to a folder icon representing a folder of the filesystem (str)
<i>with_buttons</i>	a flag depicting whether buttons for browsing pages is wanted (True) or not (False) (bool)

Returns

None

Definition at line 596 of file SIEffect.py.

6.1.3.17 emit_linking_action()

```
None SIEffect.SIEffect.emit_linking_action (
    self,
    object sender,
    str capability,
    tuple args )
```

member function for emitting a linking action

Parameters

<i>sender</i>	the source of the the linking action
<i>capability</i>	the capability with which the linking action shall be emitted
<i>args</i>	the data which is to be received by receivers

Returns

None

Definition at line 505 of file SIEffect.py.

6.1.3.18 enable_effect()

```
None SIEffect.SIEffect.enable_effect (
    self,
    str capability,
    bool is_emit,
    object on_enter,
    object on_continuous,
    object on_leave )
```

member function for enabling the emission or reception of an effect

This function is used in order to register collision events. During loading of plugins, the SIGRun plugin transpiler adds this function to the constructor of transpiled plugins based on the information provided in the associated Decorator

Parameters

<i>self</i>	the object pointer
<i>capability</i>	the capability of the collision event (str)
<i>is_emit</i>	the variable depicting if a region emits (True) or receives (False) an effect (bool)
<i>on_enter</i>	the function to be called for the collision event PySI.ON_ENTER
<i>on_continuous</i>	the function to be called for the collision event PySI.ON_CONTINUOUS
<i>on_leave</i>	the function to be called for the collision event PySI.ON_LEAVE

See also

```
on_enter(capability, transmission_type):
on_continuous(capability, transmission_type):
on_leave(capability, transmission_type):
```

Returns

None

Definition at line 355 of file SIEffect.py.

6.1.3.19 enable_link_emission()

```
None SIEffect.SIEffect.enable_link_emission (
    self,
    str emission_capability,
    object emission_function )
```

member function for enabling the emission of data in the context of a link event

This function is used in order to register linking actions for emission. During loading of plugins, the SIGRun plugin transpiler adds this function to the constructor of transpiled plugins based on the information provided in the associated decorator.

Parameters

<i>self</i>	the object pointer
<i>emission_capability</i>	the capability of the linking event (str)
<i>emission_function</i>	the function to be called for emitting data

See also

[on_link](#)(transmission_type, emission_capability, reception_capability=None)

Returns

None

Definition at line 417 of file SIEffect.py.

6.1.3.20 enable_link_reception()

```
None SIEffect.SIEffect.enable_link_reception (
    self,
    str emission_capability,
    str reception_capability,
    object reception_function )
```

member function for enabling the emission of data in the context of a link event

This function is used in order to register linking actions for reception. During loading of plugins, the SIGRun plugin transpiler adds this function to the constructor of transpiled plugins based on the information provided in the associated decorator.

Parameters

<i>self</i>	the object pointer
<i>emission_capability</i>	the capability of the linking event used by the emitting region (str)
<i>reception_capability</i>	the capability of the linking event of a receiving region (str)
<i>reception_function</i>	the function to be called for receiving data

See also

[on_link](#)(transmission_type, emission_capability, reception_capability=None)

Returns

None

Definition at line 433 of file SIEffect.py.

6.1.3.21 `get_QML_data()`

```
object SIEffect.SIEffect.get_QML_data (
    self,
    str key,
    int datatype )
```

member function for getting data set from an associated qml file of a region effect

Parameters

<i>self</i>	the object pointer
<i>key</i>	the key specified in QML to address the required data
<i>datatype</i>	the data type of the requested value (PySI.DataType.INT, PySI.DataType.FLOAT, ...) (int)

Returns

the value queried by the key as the given datatype

Definition at line 526 of file SIEffect.py.

6.1.3.22 `get_region_height()`

```
int SIEffect.SIEffect.get_region_height (
    self )
```

member function for retrieving the maximum height of a region

Parameters

<i>self</i>	the pointer to the object
-------------	---------------------------

Returns

the width of the associated region as int

Definition at line 303 of file SIEffect.py.

6.1.3.23 `get_region_width()`

```
int SIEffect.SIEffect.get_region_width (
    self )
```

member function for retrieving the maximum width of a region

Parameters

<i>self</i>	the pointer to the object
-------------	---------------------------

Returns

the width of the associated region as int

Definition at line 295 of file SIEffect.py.

6.1.3.24 is_effect_enabled()

```
bool SIEffect.SIEffect.is_effect_enabled (
    self,
    str capability,
    bool is_emit )
```

member function for determining whether a collision event exists

Parameters

<i>self</i>	the object pointer
<i>capability</i>	the capability of the collision event (str)
<i>is_emit</i>	the transmission type (bool)

Returns

True if a collision event exists with the given capability and transmission type, False else

Definition at line 368 of file SIEffect.py.

6.1.3.25 move()

```
None SIEffect.SIEffect.move (
    self,
    x,
    y )
```

member function for moving the effect's associated region to the point (x, y)

Parameters

<i>self</i>	the object pointer
<i>x</i>	the absolute x coordinate of the point
<i>y</i>	the absolute y coordinate of the point

Returns

None

Definition at line 672 of file SIEffect.py.

6.1.3.26 on_continuous()

```
def SIEffect.SIEffect.on_continuous (
    capability,
    transmission_type ) [static]
```

Decorator for registering on_continuous collision events.

Decorates a specific function in other plugin files to be used as an on_continuous collision event. Recommended use: @SIEffect.on_continuous(<capability>, <transmission_type>)

This decorator adds no functionality and only provides easier syntax for defining on_continuous collision events. The decorator is detected by the SIGRun plugin transpiler during the plugin loading step. In this step, the transpiler removes the decorator and appends an equivalent function call to the plugin's constructor, in order to register the on_continuous collision event.

Parameters

<i>capability</i>	the str value serving as the identifier for the on_continuous collision event
<i>transmission_type</i>	the bool value serving to determine whether the event shall be emitted (SIEffect.EMISSION) or received (SIEffect.RECEPTION)

Returns

the decorated function

Definition at line 68 of file SIEffect.py.

6.1.3.27 on_enter()

```
def SIEffect.SIEffect.on_enter (
    capability,
    transmission_type ) [static]
```

Decorator for registering on_enter collision events.

Decorates a specific function in other plugin files to be used as an on_enter collision event. Recommended use: @SIEffect.on_enter(<capability>, <transmission_type>)

This decorator adds no functionality and only provides easier syntax for defining on_enter collision events. The decorator is detected by the SIGRun plugin transpiler during the plugin loading step. In this step, the transpiler removes the decorator and appends an equivalent function call to the plugin's constructor, in order to register the on_enter collision event.

Parameters

<i>capability</i>	the str value serving as the identifier for the on_enter collision event
<i>transmission_type</i>	the bool value serving to determine whether the event shall be emitted (SIEffect.EMISSION) or received (SIEffect.RECEPTION)

Returns

the decorated function

Definition at line 47 of file SIEffect.py.

6.1.3.28 on_leave()

```
def SIEffect.SIEffect.on_leave (
    capability,
    transmission_type ) [static]
```

Decorator for registering on_leave collision events.

Decorates a specific function in other plugin files to be used as an on_leave collision event. Recommended use: @SIEffect.on_leave(<capability>, <transmission_type>)

This decorator adds no functionality and only provides easier syntax for defining on_leave collision events. The decorator is detected by the SIGRun plugin transpiler during the plugin loading step. In this step, the transpiler removes the decorator and appends an equivalent function call to the plugin's constructor, in order to register the on_leave collision event.

Parameters

<i>capability</i>	the str value serving as the identifier for the on_leave collision event
<i>transmission_type</i>	the bool value serving to determine whether the event shall be emitted (SIEffect.EMISSION) or received (SIEffect.RECEPTION)

Returns

the decorated function

Definition at line 89 of file SIEffect.py.

6.1.3.29 on_link()

```
def SIEffect.SIEffect.on_link (
    transmission_type,
    emission_capability,
    reception_capability = None ) [static]
```

Decorator for registering linking actions.

Decorates a specific function in other plugin files to be used as an linking action. Recommended use: `@SIEffect.on_link(<transmission_type>, <emission_capability>, <reception_capability>)`

This decorator adds no functionality and only provides easier syntax for defining linking actions. The decorator is detected by the SIGRun plugin transpiler during the plugin loading step. In this step, the transpiler removes the decorator and appends an equivalent function call to the plugin's constructor, in order to register the linking action. Here, the transpiler differentiates the emission of a linking action: `@SIEffect.on_link(SIEffect.EMISSION, <capability>)` and the reception of a linking action: `@SIEffect.on_link(SIEffect.Reception, <emission_capability>, <reception_capability>)`

Parameters

<i>transmission_type</i>	the bool value serving to determine whether the event shall be emitted (SIEffect.EMISSION) or received (SIEffect.RECEPTION)
<i>emission_capability</i>	the str value serving as the identifier of with which the linking action was emitted from its source
<i>reception_capability</i>	the str value serving as the identifier of with which the linking action shall be received

Returns

the decorated function

Definition at line 113 of file SIEffect.py.

6.1.3.30 override_effect()

```
None SIEffect.SIEffect.override_effect (
    self,
    str capability,
    bool is_emit,
    object on_enter,
    object on_continuous,
    object on_leave )
```

member function for overriding the emission or reception of an effect

Parameters

<i>self</i>	the object pointer
<i>capability</i>	the capability of the collision event (str)
<i>is_emit</i>	the variable depicting if a region emits (True) or receives (False) an effect (bool)
<i>on_enter</i>	the function to be called for the collision event PySI.ON_ENTER
<i>on_continuous</i>	the function to be called for the collision event PySI.ON_CONTINUOUS
<i>on_leave</i>	the function to be called for the collision event PySI.ON_LEAVE

This function then calls `self.enable_effect(capability, is_emit, on_enter, on_continuous, on_leave)`

See also

```
self.enable_effect(capability, is_emit, on_enter, on_continuous, on_leave)
```

Returns

None

Definition at line 387 of file SIEffect.py.

6.1.3.31 register_region_from_drawing()

```
None SIEffect.SIEffect.register_region_from_drawing (
    self,
    str cursor_id )
```

member function for registering a region drawing according to a cursor id

Parameters

<i>self</i>	the object pointer
<i>cursor↔ _id</i>	the id of the cursor which is currently drawing (str)

This function is specific to effects of PySI.EffectType.SI_CANVAS. Therefore, this function does nothing when called with other effect types.

Returns

None

Definition at line 565 of file SIEffect.py.

6.1.3.32 relative_x_pos()

```
int SIEffect.SIEffect.relative_x_pos (
    self )
```

member function for getting the relative x coordinate of the parent region's top left corner

Parameters

<i>self</i>	the object pointer
-------------	--------------------

Returns

the relative x coordinate of the associated region's top left corner

Definition at line 311 of file SIEffect.py.

6.1.3.33 relative_y_pos()

```
int SIEffect.SIEffect.relative_y_pos (
    self )
```

member function for getting the relative y coordinate of the parent region's top left corner

Parameters

<i>self</i>	the object pointer
-------------	--------------------

Returns

the relative y coordinate of the associated region's top left corner

Definition at line 319 of file SIEffect.py.

6.1.3.34 remove_link()

```
None SIEffect.SIEffect.remove_link (
    self,
    str sender_uuid,
    str sender_attribute,
    str receiver_uuid,
    str receiver_attribute )
```

member function for removing a specified link between two regions according to given attributes

Parameters

<i>self</i>	the object pointer
<i>sender_uuid</i>	the uuid of the emitting region (str)
<i>sender_attribute</i>	the attribute to be linked by the emitting region (str)
<i>receiver_uuid</i>	the uuid of the receiving region (str)
<i>receiver_attribute</i>	the attribute to be linked by the receiving region (str)

Returns

None

Definition at line 491 of file SIEffect.py.

6.1.3.35 set_QML_data()

```
None SIEffect.SIEffect.set_QML_data (
    self,
    str key,
    object value,
    int datatype,
    data_kwargs = {} )
```

member function for setting data in the associated qml file of a region effect

Parameters

<i>self</i>	the object pointer
<i>key</i>	the variable specified in the qml file (str)
<i>value</i>	the value to set in the variable in the qml file (variant)
<i>datatype</i>	the data type of the value (PySI.INT, PySI.FLOAT, ...) (int)

Returns

None

Definition at line 516 of file SIEffect.py.

6.1.3.36 set_QML_path()

```
str SIEffect.SIEffect.set_QML_path (
    self,
    str filename )
```

member function for setting the path to an plugin's associated qml file

Parameters

<i>self</i>	the object pointer
<i>filename</i>	the file name of the target qml file

Returns

the absolute path to the qml file (str)

Definition at line 535 of file SIEffect.py.

6.1.3.37 snap_to_mouse()

```
None SIEffect.SIEffect.snap_to_mouse (
    self )
```

member function for snapping a region's center to the mouse cursor

Parameters

<i>self</i>	the object pointer
-------------	--------------------

Returns

None

Definition at line 641 of file SIEffect.py.

6.1.3.38 start_standard_application()

```
None SIEffect.SIEffect.start_standard_application (
    self,
    str file_uuid,
    str file_path )
```

member function for starting the standard application of a file given its uuid as a region and its path in the filesystem

Parameters

<i>self</i>	the object pointer
<i>file_uuid</i>	the uuid of the region associated to a file icon representing a file of the filesystem (str)
<i>file_path</i>	the path of the file in the filesystem (str)

Returns

None

Definition at line 576 of file SIEffect.py.

6.1.4 Member Data Documentation

6.1.4.1 cap_emit

`SIEffect.SIEffect.cap_emit`

member attribute variable storing keys to functions which are called when collision events occur for emitting data to receiving regions

This variable is a `PySI.String2_String2FunctionMap_Map` (c++-bindings) and uses capabilities (str) as keys to the inner `String2FunctionMap`. The inner `String2FunctionMap` uses collision event names (`PySI.ON_ENTER` ("on_enter"), `PySI.ON_CONTINUOUS` ("on_continuous"), `PySI.ON_LEAVE` ("on_leave")) as keys to their corresponding functions as values

Example:

```
self.cap_emit["CAPABILITY"] = {PySI.ON_ENTER: self.<function_enter>, PySI.ON_CONTINUOUS: self.<function_↵
_continuous>, PySI.ON_LEAVE: self.<function_leave>}
```

Therefore, this example allows a region to emit an effect of CAPABILITY once a collision event occurred

Definition at line 239 of file `SIEffect.py`.

6.1.4.2 cap_link_emit

`SIEffect.SIEffect.cap_link_emit`

member attribute variable storing keys to functions which are called when linking events occur for emitting data to receiving regions

This variable is a `String2FunctionMap` (c++-bindings) containing capabilities (str) as keys and functions as values

Example with SI-integrated linking of positions for emission case: `self.cap_link_emit[PySI.POSITION] = self.<function_position_emit>` Therefore, this example emits the positional data of the region to a linked region.

Definition at line 264 of file `SIEffect.py`.

6.1.4.3 cap_link_rcv

`SIEffect.SIEffect.cap_link_rcv`

member attribute variable storing keys to functions which are called when linking events occur for emitting data to receiving regions

This variable is a `PySI.String2_String2FunctionMap_Map` (c++-bindings) and uses linking event capability names (str) as keys to the inner `String2FunctionMap`. The inner `String2FunctionMap` uses linking event capability names (`PySI.POSITION`, `<own name="" as="" str>="">`) as keys to their corresponding functions as values. The outer key corresponds to the emission capability. The inner key corresponds to the reception capability of the targeted region and points towards the function which is to be called during the linking event Therefore, it is possible to map e.g. incoming positional data to the color of the receiving region.

Example with SI-integrated linking of positions for reception case: `self.cap_link_rcv[PySI.POSITION][PySI.POSI↵
TION] = self.<function_position_emit>` `self.cap_link_rcv[PySI.POSITION][PySI.COLOR] = self.<function_color↵
_emit>` Therefore, this example receives the positional data of a linked region and can apply this data to other categories of data according to the linking relationship.

Definition at line 282 of file `SIEffect.py`.

6.1.4.4 cap_recv

```
SIEffect.SIEffect.cap_recv
```

member attribute variable storing keys to functions which are called when collision events occur for receiving data from emitting regions

This variable is a `PySI.String2_String2FunctionMap_Map` (c++-bindings) and uses capabilities (str) as keys to the inner `String2FunctionMap`. The inner `String2FunctionMap` uses collision event names (`PySI.ON_ENTER` ("on_enter"), `PySI.ON_CONTINUOUS` ("on_continuous"), `PySI.ON_LEAVE` ("on_leave")) as keys to their corresponding functions as values

Example:

```
self.cap_recv["CAPABILITY"] = {PySI.ON_ENTER: self.<function_enter>, PySI.ON_CONTINUOUS: self.<function_↵_continuous>, PySI.ON_LEAVE: self.<function_leave>}
```

Therefore, this example allows a region to receive an effect of CAPABILITY once a collision event occurred

Definition at line 251 of file `SIEffect.py`.

6.1.4.5 color

```
SIEffect.SIEffect.color
```

member attribute variable containing the fill color of a region in RGBA as a `PySI.Color`

Definition at line 198 of file `SIEffect.py`.

6.1.4.6 delta_x

```
SIEffect.SIEffect.delta_x
```

member attribute variable containing the last relative movement of the region according to the x axis as a float

Definition at line 186 of file `SIEffect.py`.

6.1.4.7 delta_y

```
SIEffect.SIEffect.delta_y
```

member attribute variable containing the last relative movement of the region according to the y axis as a float

Definition at line 189 of file `SIEffect.py`.

6.1.4.8 EMISSION

```
bool SIEffect.SIEffect.EMISSION = True [static]
```

member constant to mark an effect or link emittable

Definition at line 17 of file SIEffect.py.

6.1.4.9 height

```
SIEffect.SIEffect.height
```

member variable containing the maximum height of the region

computed via aabb

Definition at line 160 of file SIEffect.py.

6.1.4.10 is_under_user_control

```
SIEffect.SIEffect.is_under_user_control
```

member attribute variable which is true when an user directly controls the region (e.g. moving it around) as a bool

Definition at line 201 of file SIEffect.py.

6.1.4.11 last_x

```
SIEffect.SIEffect.last_x
```

member attribute variable containing the last absolute x coordinate as a float

Definition at line 192 of file SIEffect.py.

6.1.4.12 last_y

```
SIEffect.SIEffect.last_y
```

member attribute variable containing the last absolute y coordinate as a float

Definition at line 195 of file SIEffect.py.

6.1.4.13 mouse_x

```
SIEffect.SIEffect.mouse_x
```

member attribute variable storing the x position of the mouse cursor

Definition at line 285 of file SIEffect.py.

6.1.4.14 mouse_y

```
SIEffect.SIEffect.mouse_y
```

member attribute variable storing the y position of the mouse cursor

Definition at line 288 of file SIEffect.py.

6.1.4.15 name

```
SIEffect.SIEffect.name
```

member attribute variable containing the name of a drawn region as a str

Definition at line 166 of file SIEffect.py.

6.1.4.16 NO_RESAMPLING

```
bool SIEffect.SIEffect.NO_RESAMPLING = False [static]
```

static member attribute to notify SIGRun to not resample a region's shape when changed from PySI Use with caution! May lead to unexpected / barely debuggable behaviour!

Definition at line 31 of file SIEffect.py.

6.1.4.17 qml_path

```
SIEffect.SIEffect.qml_path
```

member attribute variable containing the path to a QML file for styling of a drawn region as a str

This value can be left empty if no visualization of the region is intended (e.g. Container-Regions for External Applications or MouseCursor)

See also

- Container
- MouseCursor

Definition at line 183 of file SIEffect.py.

6.1.4.18 RECEPTION

```
bool SIEffect.SIEffect.RECEPTION = False [static]
```

static member attribute to mark an effect or link receivable

Definition at line 20 of file SIEffect.py.

6.1.4.19 region_type

```
SIEffect.SIEffect.region_type
```

member attribute variable containing the type of effect of a drawn region as a PySI.EffectType

Effect implementation which are currently not part of the Standard Environment Library of SIGRun are required to be of type SI_CUSTOM

Definition at line 171 of file SIEffect.py.

6.1.4.20 RESAMPLING

```
bool SIEffect.SIEffect.RESAMPLING = True [static]
```

static member attribute to notify SIGRun to resample a region's shape when changed from PySI

Definition at line 26 of file SIEffect.py.

6.1.4.21 shape

```
SIEffect.SIEffect.shape
```

member attribute variable containing the shape (contour) of a drawn region as a PySI.PointVector

Definition at line 143 of file SIEffect.py.

6.1.4.22 source

```
SIEffect.SIEffect.source
```

member attribute variable containing the source of effect of a drawn region as a str

Effect implementation which are currently not part of the Standard Environment Library of SIGRun are encouraged to not start with "libStdSI"

Definition at line 176 of file SIEffect.py.

6.1.4.23 texture_height

```
SIEffect.SIEffect.texture_height
```

member attribute variable storing the height of a texture of a region drawing as a float

This value is only set if texture_path is a valid path

Definition at line 218 of file SIEffect.py.

6.1.4.24 texture_path

```
SIEffect.SIEffect.texture_path
```

member attribute variable storing the path to the image file used as texture for a region

Definition at line 207 of file SIEffect.py.

6.1.4.25 TEXTURE_PATH_NONE

```
string SIEffect.SIEffect.TEXTURE_PATH_NONE = "" [static]
```

static member attribute to signal that it's associated effect does not display an icon (texture) when drawn as a region

Definition at line 23 of file SIEffect.py.

6.1.4.26 texture_width

```
SIEffect.SIEffect.texture_width
```

member attribute variable storing the width of a texture of a region drawing as a float

This value is only set if texture_path is a valid path

Definition at line 213 of file SIEffect.py.

6.1.4.27 width

```
SIEffect.SIEffect.width
```

member attribute variable containing the axis-aligned bounding-box (aabb) of a drawn region as a PySI.PointVector

This variable is automatically computed when shape is changed. It is recommended to use this variable read-only.
member variable containing the maximum width of the region

computed via aabb

Definition at line 155 of file SIEffect.py.

6.1.4.28 with_border

`SIEffect.SIEffect.with_border`

member attribute variable serving as a rendering hint for showing a regions border

Definition at line 137 of file SIEffect.py.

6.1.4.29 x

`SIEffect.SIEffect.x`

Definition at line 642 of file SIEffect.py.

6.1.4.30 y

`SIEffect.SIEffect.y`

Definition at line 643 of file SIEffect.py.
